4 guides. Regenerate: `node scripts/customer-docs/generate-guide-index.mjs` .

Admin Basics

Purpose

Packaging, privileges, systemd integration, and ops.

How to get there

- Topic id: `admin-basics`
- Section: **Admin** → **Admin Basics**

Guide

Topic	Guidance
Service	Use packaged systemd units when available; run unprivileged where the upstream docs allow
Logs	<code>journalctl -u <unit> -f</code> or container logs per deploy method
Security	Follow upstream <code>SECURITY.md</code> ; restrict config file permissions
Support	GitHub issues · Contact Zyvor for Enterprise

See also [Getting started](#).

Operate from the console (UX)

1. Open this route from the nav or command palette and wait for live API data.
2. Use filters/search when present; drill into a row for detail.
3. For mutating actions: confirm role gates and impact before applying.
4. **Empty / fail:** Check service health, auth, and that required CRDs/backends for this domain are installed.
5. **Success:** Live data loads; created/updated objects appear without error toasts.

Getting Started

Purpose

Install netctl and apply your first network config.

How to get there

- Topic id: `getting-started`
- Section: **Onboarding** → **Getting Started**

Guide

netctl is an async Linux network CLI for links, addresses, routes, DNS, and hostname — plus declarative YAML/TOML `apply` with dry-run and `doctor` diagnostics. This page gets you from a fresh checkout to your first applied config.

Prerequisites

- A Linux host with `sudo` /root access — link, address, and route changes require privileges.
- netctl built and installed: clone github.com/zyvorai/netctl and follow the build/install steps in the upstream README (source of truth for release artifacts and packaging).
- systemd-networkd and systemd-resolved present if you want netctl's integration with them; Netlink is used directly for links/addresses/routes either way.

1. Check current state

```
sudo netctl show
```

2. Make a change

```
sudo netctl link set eth0 state up
```

3. Apply a declarative config

```
sudo netctl apply config/network-config.example.yaml
```

`apply` reads YAML or TOML, backs up the prior state automatically, and supports diff/restore — see [Configuration](#) for the file format.

Troubleshooting

- `apply` / `link` / `addr` commands fail with a **permission error** — rerun with `sudo`; netctl needs root to touch links, addresses, and routes.
- **Changes don't take effect on a systemd-networkd host** — confirm `systemd-networkd` / `systemd-resolved` are active; netctl integrates with them rather than replacing them.

Workflows

Purpose

Day-2 link, address, route, doctor, and apply jobs.

How to get there

- Topic id: workflows
- Section: **Operations → Workflows**

Guide

Workflow	Steps
Lab install	Clone → build → install binary → enable systemd unit (if applicable)
Validate	Run status/health command → check logs → confirm metrics or API
Upgrade	Stop service → replace binary → migrate config if release notes require → start service

For netctl-specific examples, see the upstream `docs/` tree and tutorials on GitHub.

Operate from the console (UX)

1. Open this route from the nav or command palette and wait for live API data.
2. Use filters/search when present; drill into a row for detail.
3. For mutating actions: confirm role gates and impact before applying.
4. **Empty / fail:** Check service health, auth, and that required CRDs/backends for this domain are installed.
5. **Success:** Live data loads; created/updated objects appear without error toasts.

Configuration

Purpose

YAML/TOML declarative config format and backends.

How to get there

- Topic id: `configuration`
- Section: **Setup → Configuration**

Guide

netctl's config surface is the file you pass to `apply` — a YAML or TOML description of links, addresses, routes, DNS, and hostname — plus the systemd-networkd/resolved state it integrates with on the host.

Config file format

```
sudo netctl apply config/network-config.example.yaml
```

The example file in the repo (`config/network-config.example.yaml`) is the starting point — copy and edit it for your host's links, addresses, routes, DNS, and hostname. TOML is also accepted.

Safety around `apply`

- `apply` supports a dry-run mode so you can preview the diff before it touches the running network state.
- Every apply is backed up automatically, so you can restore or diff against the previous configuration if a change goes wrong.
- Run `netctl doctor` to check the current state for problems before or after applying.

Watching and scripting

netctl supports JSON output and a watch mode, plus shell completions — useful for wiring `netctl show / netctl apply` into GitOps or config-management pipelines instead of hand-running commands.

Troubleshooting

- **`apply` reports a conflict with systemd-networkd** — netctl integrates with systemd-networkd/resolved rather than owning the link exclusively; check for a competing `.network` file.
- **Unsure what a config change will do** — use the dry-run preview first, and keep the automatic backup so you can restore if the applied state isn't what you expected.
